1 | THE ARTICLE HEADER INFORMATION

YAML header:

output:

rticles::sim_article:
 keep_tex: TRUE

Configure the YAML header including the following elements:

- title: Title
- author: List of author(s) containing name and num
- address: List containing num and org for defining author affiliations
- presentaddress: Not sure what they mean with this
- corres: Author and address for correspondence
- authormark: Short author list for header
- received, revised, accepted: dates of submission, revision, and acceptance of the manuscript
- abstract: Limited to 250 words
- keywords: Up to 6 keywords
- bibliography: BibTeX .bib file
- classoption: options of the WileyNJD-v2 class
- longtable: set to true to include the longtable package, used by default from pandoc to convert markdown to LATEXcode

2 Uthor et al.

1.1 | Remarks

- 1. In authormark use *et al*. if there are three or more authors.
- 2. Note the use of num to link names and addresses.
- 3. For submitting a double-spaced manuscript, add doublespace as an option to a classoption line in the YAML header: classoption: doublespace.
- 4. Keywords are separated by semicolons.

2 | THE BODY OF THE ARTICLE

2.1 | Mathematics

Use mathematics in Rmarkdown as usual.

2.2 | Figures and Tables

Figures are supported from R code:

```
x = rnorm(10)
y = rnorm(10)
plot(x, y)
```

...and can be referenced (Figure 1) by including the \\label{} tag in the fig.cap attribute of the R chunk: fig.cap = "Fancy Caption\\label{fig:plot}". It is a quirky hack at the moment, see here.

Analogously, use Rmarkdown to produce tables as usual:

```
if (!require("xtable")) install.packages("xtable")
## Loading required package: xtable

xt <- xtable(head(cars), caption = "A table", label = "tab:table")
print(xt, comment = FALSE)</pre>
```

	speed	dist
1	4.00	2.00
2	4.00	10.00
3	7.00	4.00
4	7.00	22.00
5	8.00	16.00
6	9.00	10.00

TABLE 1 A table

Referenced via 1. You can also use the YAML option header-includes to includes custom LATEX packages for tables (keep in mind that pandoc uses longtables by default, and it is hardcoded; some things may require including the package longtable). E.g., using ctable:

```
header-includes:
```

- \usepackage{ctable}

Uthor et al.

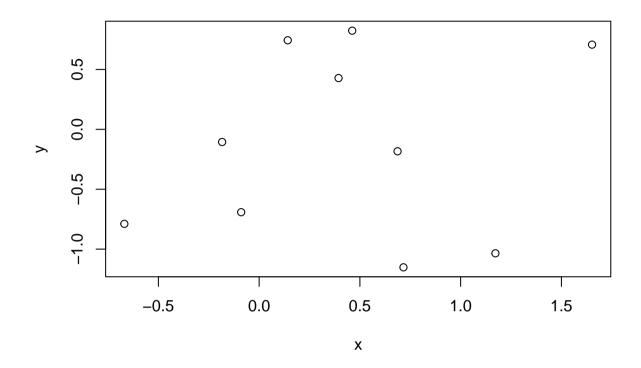

FIGURE 1 Fancy Caption

Then, just write straight-up \LaTeX code and reference is as usual (tab:ctable):

```
\ctable[cap = {Short caption},
        caption = {A long, long, long, long, long caption for this table.},
        label={tab:ctable},]
        {cc}
        {
        \tnote[$\ast$]{Footnote 1}
        \tnote[$\dagger$]{Other footnote}
        \tnote[b]{Mistakes are possible.}
        }{
        \FL
        COL 1\tmark[a] & COL 2\tmark[$\ast$]
        6.92\tmark[\$\dagger\$] \& 0.09781 \
        6.93\tmark[$\dagger$] & 0.09901 \\
        97 & 2000
        \LL
}
```

It is also possible to set the YAML option longtable: true and use markdown tables (or the knitr::kable function): knitr::kable(head(cars)) produces the same table as the xtable example presented before.

4 Uthor et al.

2.3 | Cross-referencing

The use of the Rmarkdown equivalent of the LaTeXcross-reference system for figures, tables, equations, etc., is encouraged (using [@<name>], equivalent of \ref{<name>} and \labelf<name>}). That works well for citations in Rmarkdown, not so well for figures and tables. In that case, it is possible to revert to standard LaTeXsyntax.

2.4 | Double Spacing

If you need to double space your document for submission please use the doublespace option in the header.

3 | BIBLIOGRAPHY

Link a .bib document via the YAML header, and bibliography will be printed at the very end (as usual). The default bibliography style is provided by Wiley as in WileyNJD-AMA.bst, do not delete that file.

Use the Rmarkdown equivalent of the LATEXcitation system using [0<name>]. Example: 1, 2,3.

To include all citation from the .bib file, add \nocite{*} before the end of the document.

4 | FURTHER INFORMATION

All LaTeX environments supported by the main template are supported here as well; see the .tex sample file here for more details and example.
